SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No	Sub Q.N.	Answer	Marking Scheme
1.	(a) Ans.	Attempt any FIVE of the following: List any four operations on data structure. Operations on data structure: <ul style="list-style-type: none">• Insertion• Deletion• Searching• Sorting• Traversing• Merging	10 2M <i>Any four operations ^{1/2}M each</i>
	(b) Ans.	Enlist queue operation condition. 1. Queue Full 2. Queue Empty	2M <i>Two operational conditions 1M each</i>

SUMMER – 2019 EXAMINATION

2.	<p>(a) Ans.</p>	<p>Attempt any THREE of the following: Explain the working of Binary search with an example. Binary search is performed only on sorted array. Search method starts with calculating mid position from an array and compare the mid position element with the search element. If a match is found then the search process ends otherwise divide the i/p list into 2 parts. First part contains all the numbers less than mid position element and second part contains all the numbers greater than mid position element. Then select one of the part depending on search element is less or greater than mid position element and calculate mid position for selected part. Again compare mid position element with search element. The binary search performs comparison and division task the element is found or division of list gives one element for comparison. To calculate mid element perform (lower + upper) / 2. lower-lower index position of an array (initially 0) upper-upper index position of an array (initially size-1)</p>	<p>12 4M</p> <p><i>Explana tion 2M</i></p>

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

3. $j=2, i=0$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	50	6	22	3	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

4. $j=3, i=0$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	50	6	22	3	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

5. $j=4$, since $a[j] \leq \text{pivot}$ do, $i++$ and $\text{swap}(a[i], a[j])$
 $i=1$

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

6. $j=5, i=1$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

7. $j=6, i=1$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

8. $j=7, i=1$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

9. $j=8, i-1$ since $a[j] > \text{pivot}$ do nothing array will remain same

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

We come out of loop because j is now equal to $\text{high}-1$.

Finally we place pivot at correct position by swapping $a[i+1]$ and $a[h]$ (or pivot)

$a[] = \{2, 3, 5, 22, 50, 39, 49, 25, 18, 6\}$ // 6 and 5 Swapped

Now, 5 is at its correct place. All elements smaller than 5 are before it and all elements greater than 5 are after it.

Similarly rest of the passes will be executed and will provide the following output

Output of pass 1

Array elements	2	3	5	22	50	39	49	25	18	6
indexes	0	1	2	3	4	5	6	7	8	9

Pass 2

$A[] = \{2, 3\}$ pivot=3

Array elements	2	3	5
indexes	0	1	2

$a[] = \{22, 50, 39, 49, 25, 18, 6\}$ pivot=6

Array elements	6	50	39	49	25	18	22
indexes	3	4	5	6	7	8	9

$a[] = \{50, 39, 49, 25, 18, 22\}$ pivot=22

Array elements	18	22	49	25	50	39
indexes	4	5	6	7	8	9

SUMMER – 2019 EXAMINATION
MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

	<p>(c) Ans.</p>	<p>Write an algorithm to count number of nodes in singly linked list. Let start is pointer variable which always stores address of first node in single linked list. If single linked list is empty then start will point to NULL. q is pointer variable used to store address of nodes in single linked list. Step 1: Start Step 2: [Assign starting address of single linked list to pointer q] q=start Step 3: [Initially set count of nodes in Linked list as zero] count=0 Step 4: [Check if Linked list empty or not] if start==NULL Display “Empty Linked List” go to step 6. Step 5: [Count number of nodes in single linked list] while q!=NULL count++ and q=q->next; Step 6: Display count (total number of nodes in single linked list) Step 7: stop</p>	<p>6M <i>Correct algorithm 6M</i></p>
<p>6.</p>	<p>(a) Ans.</p>	<p>Attempt any TWO of the following: Sort the following numbers in ascending order using Bubble sort. Given numbers: 29, 35, 3, 8, 11, 15, 56, 12, 1, 4, 85, 5 & write the output after each interaction. Pass 1 Enter no of elements :12 Enter array elements :29 35 3 8 11 15 56 12 1 4 85 5 Unsorted Data: 29 35 3 8 11 15 56 12 1 4 85 5</p>	<p>12 6M</p>
