(ISO/IEC - 27001 - 2005 Certified)

SUMMER – 2019 EXAMINATION  
MODEL ANSWER

Subject: Digital Techniques and Microprocessor

Subject Code: 22323

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No	Sub Q.N.	Answer	Marking Scheme
1.	a) Ans.	<b>Attempt any <u>FIVE</u> of the following:</b> <b>State the function of linker and debugger.</b> <b>Function of linker and debugger:</b> <b>Linker:</b> There are certain programs which are large in size and cannot be executed at one go simultaneously. Such programs are divided into sub programs also known as modules. The linker is used to link such small programs to form one large program. It also generates an executable file.  <b>Debugger:</b> Debugger is used to test and debug programs. The debugger allows a user to test a program step by step, so that the problem points or steps can be identified and rectified. It allows the user to inspect the registers and memory locations after a program has been executed.	<b>10</b> <b>2M</b>  <i>Each function</i> <i>1M</i>
	b) Ans.	<b>List any four addressing modes and give one example of each.</b> <b>Addressing Modes:</b> 1. Immediate Addressing Mode: Example: MOV CL, 03H ADD AX, 1234H	<b>2M</b>

SUMMER - 2019 EXAMINATION  
MODEL ANSWER

Subject: Digital Techniques and Microprocessor

Subject Code: 22323

i)  $(63)_{10} - (20)_{10} = ?$

$\Rightarrow (63)_{10} - (20)_{10} = (63)_{10} + (-20)_{10}$

$(63)_{10} = (9)_2$

2		63		
2		31	1	(LSB)
2		15	1	
2		7	1	
2		3	1	
2		1	1	
			1	(MSB)

2		20		
2		10	0	LSB
2		5	0	
2		2	1	
2		1	0	
			1	MSB

2M

$\therefore (63)_{10} = (111111)_2$

$\therefore (20)_{10} = (010100)_2$

For finding 2's complement of  $(20)_{10}$

1's complement of $(20)_{10}$	$\Rightarrow$	101011
+		1
<hr/>		101100
2's complement of $(20)_{10}$		

$(63)_{10} \Rightarrow$	111111	
+	$(-20)_{10} \Rightarrow$	101100
		<hr/>
		101011 $\Rightarrow (43)_{10}$
	Discard	
	Carry	

As carry is generated, result is positive and in its true form.

**MODEL ANSWER**

**Subject: Digital Techniques and Microprocessor**

**Subject Code: 22323**

*Diagram  
4M*

1.  **$\overline{INTA}$** : This is related to the non-vectored interrupt. It indicates that the processor has accepted INTR interrupt.
2. **ALE**: (Address Latch Enable): This signal is used to demultiplex the multiplexed the address and data at the falling edge of the ALE.
  - i. If  $ALE = 1 \Rightarrow AD_0-AD_{15}$  will form  $A_0-A_{15}$
  - ii. If  $ALE = 0 \Rightarrow AD_0-AD_{15}$  will form  $D_0-D_{15}$ .
3.  **$\overline{DEN}$  (Data Enable)**: It provides an output enable for the 8286 in a minimum mode which uses a transceiver. It is active LOW during each memory and I/O access and for  $\overline{INTA}$  cycle.
4.  **$DT/\overline{R}$  (Data Transmit / Receive)**: It is an output signal which controls the direction of data flow through the transceivers. If it is at logic 1 the buffers are enabled to transmit data from the 8086. If it is at logic 0 the buffers are enabled to receive data.
5.  **$M/\overline{IO}$** : It is used to distinguish a memory transfer or I/O transfer. For memory operation  $M/\overline{IO}=1$  and for I/O operation  $M/\overline{IO}=0$ .

SUMMER – 2019 EXAMINATION  
MODEL ANSWER

Subject: Digital Techniques and Microprocessor

Subject Code: 22323

	<p>MOV DS, AX</p> <p>3. Memory Addressing Mode: The memory addressing mode is classified under two categories:</p> <ul style="list-style-type: none"><li>• Direct Addressing Mode: In this 16-bit offset address is provided in the instruction itself. Here [ ] refers the contents of the offset address. Ex: MOV AL, [2000H]; MOV [1020], 5050H</li><li>• Indirect Addressing mode: In this mode the Effective address is calculated from the contents of one or two registers along with the displacement value. The indirect addressing mode is classified in five categories:<ol style="list-style-type: none"><li>i. Register Indirect Addressing Mode: In this mode EA is provided in an index register or base register. The index register can be SI or DI and the base register can be BX. EA= [BX, SI, DI] Ex: MOV [DI], 1234H; MOV AX, [BX]</li><li>ii. Based Addressing with displacement: In this mode EA is sum of an 8/16 bit displacement and the contents of base register (BX or BP). Ex: MOV AX, [BX+300H]; MOV AX, [BX-2H]</li><li>iii. Indexed Addressing Mode: In this EA is the sum of the 8/16 bit displacement plus the contents of the index registers SI or DI. Ex: MOV [DI + 2345H], 1234H; MOV AX, [SI + 45H]</li><li>iv. Based Indexed Addressing Mode: In this EA is the sum of base registers (BX or BP) and the indexed register (SI or DI) both which are specified in the instruction. Ex: MOV [BX + DI], 1234H; MOV AX, [SI + BX]</li><li>v. Based Indexed Addressing with Displacement Mode: In this EA is the sum of base registers (BX or BP) and the indexed register (SI or DI) along with the 8/16 bit displacement. Ex: MOV [DI + BX + 37H], AX; MOV AL, [BX + SI + 278H]</li></ol></li></ul> <p>4. I/O Port addressing: There are two types of I/O port addressing:</p> <ol style="list-style-type: none"><li>i. Fixed or Direct Port Addressing: In this case a one byte port</li></ol>	
--	--	--

**SUMMER – 2019 EXAMINATION**  
**MODEL ANSWER**

**Subject: Digital Techniques and Microprocessor**

**Subject Code: 22323**

		<p>address will be provided in the instruction. This allows fixed access to ports numbered 0 to 255 (00-FFH).          Ex: OUT 06H, AL; IN AX, 85H</p> <p>ii. Variable or Indirect Port Addressing: In this case port address will not be explicitly in the instruction. The address of port number is taken from DX allowing 64K 8 bit ports or 32K 16 bit ports. This mode is known as variable or indirect port address. The 8 and 16 bit I/O data transfers should take place only through AL or AX.          Ex: IN AL, DX; OUT DX, AX.</p> <p>5. Implied (Implicit) Addressing Modes: In this the instructions does not have any operand.          Ex: CLC, DAA</p>	
<b>6.</b>	<p><b>a)</b></p> <p><b>Ans.</b></p>	<p><b>Attempt any <u>TWO</u> of the following:</b></p> <p><b>Define the following term with respect the digital IC's:</b></p> <p><b>(i) Propagation delay</b>  <b>(ii) Fan in</b>  <b>(iii) Fan out</b>  <b>(iv) Power Dissipation</b>  <b>(v) Noise Margin</b>  <b>(vi) Threshold Voltage.</b></p> <p><b>(i) Propagation delay:</b> Propagation delay is defined as the time taken to obtain the O/P when the I/P is applied. It is given in nano seconds. (1 ns=10<sup>-9</sup> sec).</p> <p>The I/P and O/P wave forms of a logic gate are as follows:</p> <div style="text-align: center;"> </div> <p>The delay times are measured between 50% voltage levels of I/P &amp; O/P wave forms. There are 2 delay times <math>t_{pHL}</math> when O/P goes from high to low &amp; <math>t_{pLH}</math> when it goes from low to high. The propagation delay time of the logic gate is taken as the average of these 2 delay</p>	<p><b>12</b> <b>6M</b></p> <p style="margin-top: 20px;"><i>Each definition 1M</i></p>

**SUMMER – 2019 EXAMINATION**  
**MODEL ANSWER**

**Subject: Digital Techniques and Microprocessor**

**Subject Code: 22323**

		<p>times.</p> <p><b>(ii) Fan in:</b> Fan-In is defined as the number of inputs the gate has. For e.g. a two input gate will have fan-in equal to 2.</p> <p><b>(iii) Fan out:</b> Fan-out is the no. of similar gates which can be driven by the gate. High fan out is better as it reduces need for additional drivers to drive more gates</p> <p><b>(iv) Power dissipation:</b> Power dissipation is the power required in mW in an IC. Low power requirement indicates low speed of operation &amp; vice versa. Hence, to select an IC, figure of merit is considered. It is the product of propagation delay &amp; power, i.e. ns x mw = pJ. The gate of the lowest fig. of merit is selected.</p> <p><b>(v) Noise margin:</b> Some electric &amp; magnetic fields can induce unwanted voltages on the wires between logic circuits. They are called 'Noise Signals'. They may cause a change in <math>V_{IH}</math> or <math>V_{IL}</math> &amp; may produce undesired operation. The ability of circuit to tolerate these noise signals is called as Noise immunity. These are indicated by noise margins. If they are defined above, they are called DC noise margins. If the noise pulse width is less &amp; is approaching the propagation delay of circuit, it is called AC noise margin.</p> <p><b>(vi) Threshold voltage:</b> For any logic family, there are a number of threshold voltage levels to know:</p> <ol style="list-style-type: none"> <li>1. <math>V_{OH}</math> -- Minimum OUTPUT Voltage level a TTL device will provide for a HIGH signal.</li> <li>2. <math>V_{IH}</math> -- Minimum INPUT Voltage level to be considered a HIGH.</li> <li>3. <math>V_{OL}</math> -- Maximum OUTPUT Voltage level a device will provide for a LOW signal.</li> <li>4. <math>V_{IL}</math> -- Maximum INPUT Voltage level to still be considered a LOW.</li> </ol>	
	<b>b)</b>	<p><b>Write an assembly language program to arrange any array of 10 bytes in ascending order. Draw flowchart for the same.</b>  <i>(Note: Any other logic shall also be considered).</i></p>	<b>6M</b>
